

Build Iron Man suit

Version-1.0

We are going to build up Iron Man suit using this instruction manual. This instruction manual has two parts. Part 1, you decide the design of the part you are assigned. (It is the initial part where you will work out with basic git commands to get started with a project.) Part 2, where the entire team will come together and make the suit working. (It is the where you will add your parts to iron_man.html). Hope you are ready with all the gears. (Installed and configured git)

Tony Stark : I am Iron Man.
Let us make him one.

Part 1

1. Get a copy of the instruction manual to make the suit. (You might have already done this. Good going.)
2. How far have you reached? (Check you status)
3. Include the image of the part of the suit you are in charge of. Add that to the project.
4. How far have you reached now?
5. Have you finalised that this is the image you are going with? If, yes why don't you commit it? Do you want to change it? Go ahead and do it. :)
6. Now, make sure everyone sees what design have you chosen for your part. (Push the image)

Part 2

7. Get updated with the work going on in the team. (Get all the changes made to the repository.)
8. You don't want to mess around with others work. So create a new branch.
9. Make changes to iron_man.html file by adding the image and details of the image to it.
10. What all changes have you made till date? (Check the difference)
11. Finalise and commit the changes you have made. And you know what to do next. :)
(Don't forget to merge it with master branch.)
